EXECUTIVE SUMMARY

Ledger AI is on track to meet key milestones this quarter. The first Aura Puck units have been shipped to early testers, and initial feedback is positive. However, hardware reliability and model quality remain critical issues to address. This week, focus on resolving the Jetson Orin Nano's power management issues and enhancing the Qwen model's performance.

TOP 3 PRIORITIES THIS WEEK

1. Resolve Jetson Orin Nano Power Management Issues

- **Current Status:** The Jetson Orin Nano experiences brownout crashes when using portable power banks, affecting hardware reliability.
- **Action:** Investigate the power management settings and explore the use of a regulated power supply. Conduct a thorough review of the power circuitry to identify any potential design flaws.

2. Enhance Qwen Model Performance

- **Current Status:** The 1.5B parameter Qwen model sometimes provides shallow or repetitive answers, impacting user experience.
- **Action:** Continue the fine-tuning process on the RTX, focusing on the decoder, predictor, and style vectors. Evaluate the trade-offs between the 1.5B and 7B models to balance speed and depth.

3. Refine Voice Cloning Quality

- **Current Status:** ChatterboxTTS voice cloning quality is inconsistent, and Kokoro is being explored as an alternative.
- **Action:** Finalize the full fine-tuning process on the RTX and test the model with a variety of voice samples. Compare the results of Kokoro and Chatterbox for natural prosody and consistency.

KEY RISKS

- **Hardware Reliability:** Unreliable hardware can lead to a poor user experience and negative feedback, potentially damaging the company's reputation.
- **Model Quality:** Shallow or repetitive answers from the Qwen model can diminish user trust and satisfaction.
- **Voice Cloning Consistency:** Inconsistent voice cloning can affect the overall user experience and the perceived sophistication of the Puck.
- **Apple WWDC:** On-device Siri announcement would destroy privacy differentiation overnight. Deepen moat beyond privacy: complication platform play, medical specialization, voice cloning personalization.
- **Seed Round Timing:** Must close by June. Kaiser pilot is the path to first paying customer.

RECOMMENDED ACTIONS

- **Power Management:** Allocate a dedicated effort to investigate the brownout issue. Test the Puck with a regulated power supply and document the results. Must fix before Wired demo.
- **Model Fine-Tuning:** Complete the phased training process on the RTX, with a focus on the decoder, predictor, and style vectors. Implement hybrid 1.5B/7B approach for conversation vs deep analysis.
- **Voice Cloning Evaluation:** Finalize TTS model fine-tuning. Piper TTS training pipeline on RTX Blackwell is operational — synthetic training data generation in progress (6,950/10,000 sentences). ONNX deployment to Jetson will eliminate RVC post-processing entirely.
- **Kaiser Pilot:** Follow up with Dr. Mehta by Friday. Engage healthcare attorney for medical mode liability assessment before pilot advances.
- **Wired Demo Prep:** Ensure rock-solid boot-to-conversation flow. The demo IS the moat.
